

CP372 (Section C) – Assignment 01

RFC (Revision): Bulletin Board Client–Server Protocol

Document Status: Informational

Intended Audience: CP372 Assignment 01

Authors: Viraj Gill, Dante Rendell

Date: 6 February 2026

Upon server startup, a list of colors can be specified for use. The original RFC document stated that these specified colors must be a “JavaFX” color and would be validated before the server starts. For instance, a color that doesn’t exist within the JavaFX library, such as “blurio123”, would be rejected.

In the final implementation, however, colors are treated as simple string tokens to decouple the server from JavaFX dependencies. Visual validation is now offloaded to the client; unrecognized color strings will simply default to white to ensure the application remains robust.
